

When Was Your Last Cybersecurity Checkup?

Find out the health of your security before the next breach.

In a connected economy, organizations need to be proactive in preventing and mitigating the impacts of a cyber attack. Understanding the current state of your environment allows you to identify your vulnerabilities, and focus efforts on remediation in the right areas.

A cybersecurity health check provides a budget friendly assessment through a two-prong approach, reviewing both the business and technical areas of your environment. The result is a report that allows you to have the confidence in the areas that are doing well while addressing potential gaps. Our team of experts include CISSP, CISA, CIPT, and other key certifications to provide you with quality results.

Governance & Controls

The benchmark of every cybersecurity program are the policies, procedures, and controls in place. Our approach is to map your existing environment to the universally accepted Cybersecurity Framework (CSF). As we identify the maturity of your controls, they are tracked in a web-based tool available to you after the assessment. This allows you to continuously monitor your progress, as well as update your status and maturity rating as gaps are addressed.

Technical Assessment

Your network is the backbone of your organization's most precious asset: data. Your network grants access to critical information such as client data, personnel and financial information, as well as intellectual property. CAI performs an ethical hack of your network identifying potential areas that malicious actors could exploit. We perform this against your external Internet facing environment, your internal network, as well as your wireless network to provide a comprehensive approach.
